THINK - LONG TERM RELIABILITY

Think BurnerLogix from Fireeye!

With the introduction of the new Adaptive Infrared (IR) Amplifier technology, the BurnerLogix becomes one with the burner, no matter which fuel is being burned.

Built in techniques and algorithms allow the BurnerLogix to learn the characteristics of the fuel being burned and set its internal thresholds to optimize detection under all conditions. And when firing conditions change for the worse, the Adaptive IR system reacts properly and safely shuts the burner down.

The BurnerLogix has a smaller footprint than previous offerings, almost 50% less. With the keypad selectable parameters, most applications requirements are easily solved with one programmer module, resulting in less inventory of spare parts.

New features like 'revert to pilot' can increase a burner's turndown capability. The new pigtail wiring base can save time and labor at the OEM's and can make upgrading existing installations easy and quick.
